Cmpt431 Pre-assignment

Rafiq Dandoo

The sor_pthreads splits work among odd and even rows, alternating assignment between odd and even rows as the threads are created, then for multiple threads on the same row, it divides the row into multiple segments.

So if you had 5x5 matrix, and had four threads, it would assign 3 to the first row, 2 to the second, then split the first row in 3 and second into 2 segments.
